Quantus Cold Wallet: App Review demo

Quantus Cold Wallet is an offline signer. It holds a key, reads a transaction from a QR code shown by the Quantus hot wallet, shows what is about to be signed, and returns the signature as a QR code. It never sends anything over a network. This document has a demo key and 10 transactions to sign with it.

1. Go offline

The wallet does not create, import or unlock a key while the phone reports any connection. Turn on Airplane Mode, then make sure Wi-Fi and Bluetooth are off as well. For a quick test the **Override for Testing** button on the "Network Detected" screen lifts this lock.

2. Import the demo key

1. Tap **Import Key**, type the 24 words below separated by spaces, and tap **Import Key**.
2. Tap **Enable Face ID** or **Use Passcode only**, then **Go To Wallet**.
3. The wallet shows this account:
   `qzkiyWnN4MCXeALXfXeNckSK44Mcoyteia7ZE9mh5MUJpSyjg`
   checkphrase **Saddle-Chime-Goose-Fond-Alpha**

1 dismiss	7 isolate	13 humor	19 host
2 decline	8 inflict	14 quarter	20 purity
3 gasp	9 derive	15 capital	21 night
4 pulse	10 tiger	16 clinic	22 steel
5 orchard	11 glad	17 ride	23 transfer
6 distance	12 used	18 hour	24 proud

3. Sign a transaction

1. Tap **Scan Transaction** and allow camera access.
2. Point the camera at any QR code on the following pages, on screen or printed.
3. The review screen shows the transaction in the heading of its code. Tap **Approve and Sign** and confirm with Face ID or the passcode.
4. The signature appears as a QR code, which the hot wallet would scan to submit the transaction. Tap **Done**. **Cancel Transaction** rejects a request instead.

The demo account holds no funds and the transactions are for the Planck test network. Nothing is broadcast: the cold wallet has no network access, and only the hot wallet can submit a signed transaction.
